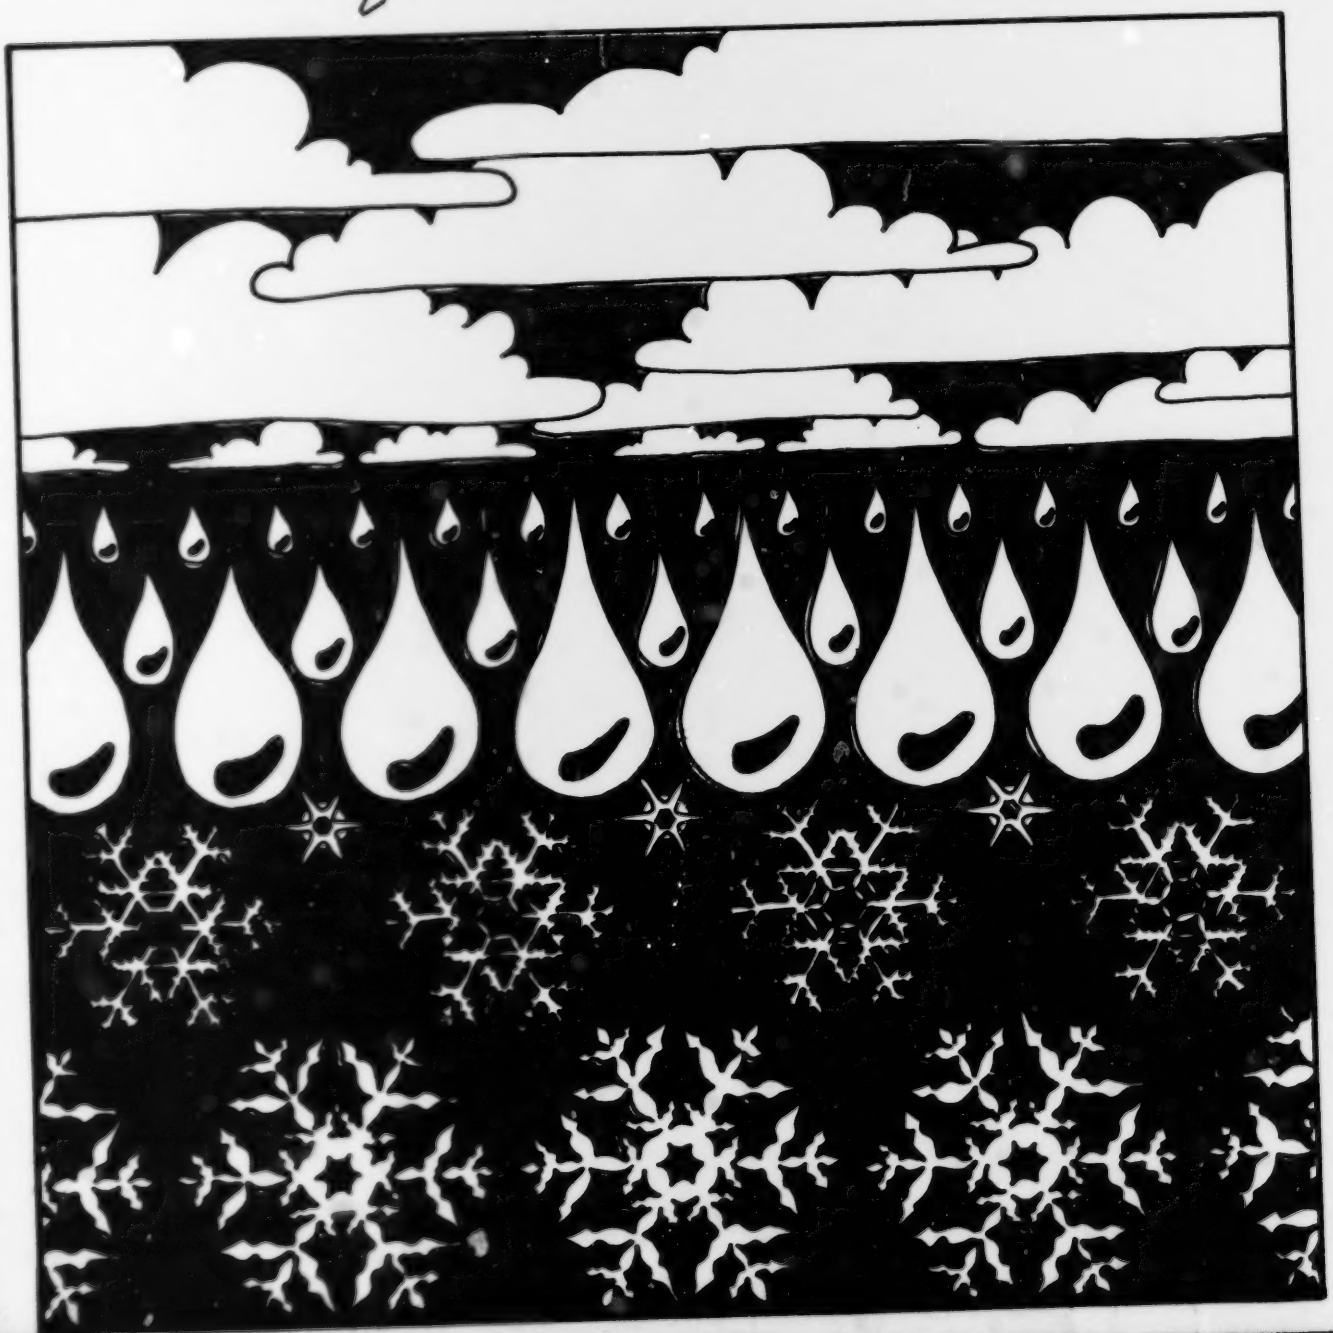
MARITIMES FOREST RESEARCH CENTRE. I
NFORMATION REPORT M-X

Summary of climatic data pertaining to the Climatic Regions of New Brunswick

H. van Groenewoud

Information Report M-X-146
Maritimes Forest Research Centre



MARITIMES FOREST RESEARCH CENTRE

The Maritimes Forest Research Centre (MFRC) is one of six regional establishments of the Canadian Forestry Service, within Environment Canada. The Centre conducts a program of work directed toward the solution of major forestry problems and the development of more effective forest management techniques for use in the Maritime Provinces.

The program consists of two major elements - research and development, and technical and information services. Most research and development work is undertaken in direct response to the needs of forest management agencies, with the aim of improving the protection, growth, and value of the region's forest resource for a variety of consumptive and non-consumptive uses; studies are often carried out jointly with provincial governments and industry. The Centre's technical and information services are designed to bring research results to the attention of potential users, to demonstrate new and improved forest management techniques, to assist management agencies in solving day-to-day problems, and to keep the public fully informed on the work of the Maritimes Forest Research Centre.

SUMMARY OF CLIMATIC DATA PERTAINING TO THE CLIMATIC REGIONS OF NEW BRUNSWICK

ABSTRACT

A summary of meteorological statistics is presented for 10 climatological regions and 14 selected stations in New Brunswick.

RESUME

On présente un sommaire des données météorologiques représintant 10 régions climatiques et 14 stations choisies au Nouveau-Brunswick.

CONTENTS

1. Introduction

2. Tables

1. Number of days with frost: a) Maxima
b) Minima
c) Means
d) Standard deviations

2. Number of days with measurable precipitation:
a) Maxima
b) Minima
c) Means
d) Standard deviations

3. Total rainfall: a) Maxima
b) Minima
c) Means
d) Standard deviations

4. Total snowfall: a) Maxima
b) Minima
c) Means
d) Standard deviations

5. Average (monthly) maximum temperatures:
a) Maxima
b) Minima
c) Means
d) Standard deviations

6. Average (monthly) minimum temperature:
a) Maxima
b) Minima
c) Means
d) Standard deviations

7. Average (monthly) mean temperature:
a) Maxima
b) Minima
c) Means
d) Standard deviations

8. Monthly temperature differences from normal:
a) Maxima
b) Minima
c) Means
d) Standard deviations

9. Extreme maximum temperatures: a) Maxima
   b) Minima
   c) Means
   d) Standard deviations

10. Extreme minimum temperatures: a) Maxima
    b) Minima
    c) Means
    d) Standard deviations

11. Number of growing degree days (base 40°F) per month:
    a) Maxima
    b) Minima
    c) Means
    d) Standard deviations

12. Weekly cumulative growing degree days (base 5°C) for 14 selected stations in New Brunswick (Alma, Bathurst, Chatham, Doaktown, Edmundston, Fredericton CDA, Gagetown, Grand Falls, Kedgwick, Moncton Airport, Rexton, St. Andrews, Saint John Airport, and Woodstock).

13. Weekly percentage frequencies of daily minimum temperatures for 14 selected stations.

14. Weekly percentage frequencies of daily maximum temperatures for 14 selected stations.

15. Percentage frequencies of weekly precipitation amounts for 14 selected stations.

16. Spring dates of last critical freeze at various risk levels for 14 selected stations.

INTRODUCTION

This report contains in table form the information extracted for each of the 10 climatic regions of New Brunswick (Fig. 1), as delineated by three multivariate statistical methods (van Groenewoud[1]).

The climatic regions of New Brunswick must be regarded as areas with more-or-less distinctive and homogeneous climates. Both terms, distinct and homogeneous, need clarification.

Firstly homogeneous: local (meso) climate is determined by the general climatic conditions prevailing in the region as brought about by gross topography, elevation, latitude and longitude, storm tracks, etc. It is, however, greatly modified by local topography; steepness of slope, aspect, exposure, position on slope, type of vegetation, all affect the local climate.

The locations of meteorological stations should be and are usually chosen to represent the climate prevailing in the general area, that is, on level or slightly concave terrain of a certain minimal size, preferably a large plateau or flatland.

Homogeneous in this context thus means that the climate, as measured at a number of stations in a region, is sufficiently similar to each other and different from others, to group them together in one climatic region. Locally, many differences can occur within a region, depending on the local topography and other factors.

"Distinct" refers to the degree of similarity among the climates of the different stations within one region, as opposed to those of the stations outside the region. The more dissimilar the regional climates are, the more distinctive the regions are.

Boundaries between regions, even when indicated by lines on the map, must not be considered absolute or very abrupt. When more and better data and analytical methods become available these boundaries may be changed. In any case, usually there are not abrupt but gradual changes in climate, except where great changes in topography coincide.

These climatic regions, besides indicating the gross climatic differences in the different parts of New Brunswick, form a reference or a framework on which, if the data are not available, to base extrapolations about the local or mesoclimate and to make a considered judgement about differences between the local climate and the typical general climate in the region.

Some general rules about the effects of local topography include:

1) East slopes are warmer in the morning but colder at night.
   South slopes are generally warmer and dryer than the typical climate.
   West slopes are colder in the morning but warmer at night.
   North slopes are generally colder than the typical climate.
   These conditions are modified by different prevailing and other winds.

2) The bottom of valleys are usually colder at night. Cold air drains into the valley, especially if vegetation is absent.

3) Vegetation, in general, has an insulating effect, extremes are less pronounces under vegetation and more pronounced without. This has important consequences for new plantations etc., where overstories are absent.

4) The steeper the slope, the more pronounced the affect.

[1]Paper submitted to the Canadian Journal of Forest Research.

For more information, meteorological textbooks should be consulted e.g., R. Geiger, 1965 "The climate near the ground" Harvard Univ. Press.

REMARKS

Users of these tables are requested to inform the author on the usefulness of the different tables and the different types of tables. If sufficient comments are accumulated attempts will be made to incorporate the suggestions in an improved version of these tables.

ACKNOWLEDGEMENTS

Tables 12 to 16 were taken from the Handbook on Agricultural and Forest Meteorology, Part II, with kind permission of the editor Dr. R.A. Treidl, of the Canadian Climate Centre, Downsview, Ontario.
